## Summary

Full-stack engineer with 5+ years taking products from design to production. Works across the stack and digs in where it counts: complex UIs, data modeling, REST and GraphQL APIs, performance optimization and production reliability. Most recently at Netflix, building security products, data pipelines, and AI developer tooling.

## Work Experience

### Netflix
*Los Gatos, California*

Software Engineer - Security Products Engineering
*Oct 2022 - Oct 2026*

- Shipped program tracking on Netflix's security metrics platform for TPMs and security leadership (**8+** programs, **3M+** data points), from PostgreSQL data models and Python GraphQL APIs to a React/TypeScript UI
- Partnered with designers to turn Figma designs into reusable React/TypeScript component libraries across products, speeding up feature delivery with a shared design language
- Designed and implemented a schema generator that builds the platform's GraphQL API and typed filters from its data model, plus the React filter components on top, shipping new filters end to end
- Cut page load times from **12s** to **2s (83%)** with a precomputed key-value cache, warmed after each indexing run within shared cluster limits
- Led the platform's migration to a federated Python GraphQL subgraph, making **150+** security metrics and entities queryable by teams across the organization
- Built the platform's release safety net (Playwright E2E UI tests, synthetic monitoring, preview environments), letting the team safely **2.5x** its code output with agent-driven development
- Built an AI agent skill automating metric data source discovery (**1hr+** saved per metric); made the team's skill library agent-agnostic, letting engineers switch AI coding tools freely
- Grew a security-task collection pipeline into the Vulnerability Management program's MVP data pipeline, unifying **1M+** findings from per-source PySpark notebooks
- Led on-call process improvements for a **9**-engineer team, aligning on shared responsibilities and practices, and interviewed intern and new-grad candidates

### Apple
*Cupertino, California*

Software Engineer Intern - User Study Tools
*Jan 2021 - Apr 2022*

- Unified two divergent versions of the team's shared Python package into a single schema, eliminating version-drift bugs, backed by end-to-end pytest coverage
- Migrated a web app's entire client side off a deprecated UI library to an open-source one, unblocking its Angular version upgrade with no regressions
- Added Django models and API endpoints to ship a user privacy feature on an internal web tool

### The Weather Network
*Oakville, Canada*

Software Developer Intern - Internal Tools
*Jan 2020 - Apr 2020*

- Built TypeScript microservices and APIs (Firebase, RxJS) that helped launch a consumer notification platform

## Skills

**Languages:** Python, TypeScript/JavaScript, GraphQL, SQL, HTML/CSS

**Frameworks & Libraries:** React, Playwright, Node.js, Vite, Angular, pytest, GraphQL Federation, FastAPI, Prisma, Django, Postgraphile

**Data & Orchestration:** PostgreSQL, PySpark, Druid, SQLAlchemy, ETL pipeline management, Temporal, Jupyter

**Infrastructure & Dev Tooling:** Docker, Spinnaker, Jenkins, OpenTelemetry, GitOps, Agent-driven development (Codex, Claude, Pi)

## Education

### University of Waterloo
*Waterloo, Canada*

Bachelor of Computer Science, Honours (co-op), Double Degree
*Sept 2017 - Aug 2022*

### Wilfrid Laurier University
*Waterloo, Canada*

Bachelor of Business Administration, Honours (co-op), Double Degree
*Sept 2017 - Aug 2022*
