Summary

Full-stack engineer with 5+ years shipping products end to end. Works across the stack and digs in where it counts: data modeling, pipelines, REST and GraphQL APIs, complex UIs, performance optimization, and production reliability. Most recently at Netflix, building security products, data pipelines, and AI developer tooling that help secure Netflix at scale.

Work Experience

Netflix
Los Gatos, California

Software Engineer - Security Products Engineering
Oct 2022 - present

- Led the migration of Netflix's in-house security metrics platform for program managers and leadership (**150+** metrics, **1M+** daily measurements) to a federated Python GraphQL subgraph, powering executive risk reports
- Built the platform's release safety net from scratch (Playwright E2E deploy gates, synthetic monitoring, preview environments), enabling the team to safely **2.5x** its code output with agent-driven development
- Built an AI agent skill automating security metric data source discovery (**1hr+** saved per metric); made the team's skill library agent-agnostic via runtime adapters, letting engineers switch AI coding tools freely
- Shipped the platform's security program tracking product end to end (**8+** programs, **3M+** data points), from PostgreSQL data models and Python GraphQL APIs to a performant, visualization-heavy React/TypeScript UI
- Cut page load times from **12s** to **2s (83%)** with a precomputed progress cache, warmed after each indexing run and throttled to stay within shared cluster limits
- Designed and implemented a schema generator that builds the platform's GraphQL API from its Druid data model, eliminating manual schema updates and enabling easier query experimentation
- Grew a security-task collection pipeline into the Vulnerability Management program's MVP data pipeline, authoring per-source PySpark notebooks and unifying **1M+** findings into one dataset for VM reporting
- Led on-call process improvements for a **9**-engineer team, aligning on shared responsibilities and practices, and interviewed intern and new-grad candidates

Apple
Cupertino, California

Software Engineer Intern - User Study Tools
Jan 2021 - Apr 2022

- Unified two divergent versions of the team's shared Python package into a single schema, eliminating version-drift bugs, backed by end-to-end pytest coverage
- Migrated a web app's entire client side off a deprecated UI library to an open-source one, unblocking its Angular version upgrade with no regressions
- Added Django models and API endpoints to ship a user privacy feature on an internal web tool

The Weather Network
Oakville, Canada

Software Developer Intern - Internal Tools
Jan 2020 - Apr 2020

- Built TypeScript microservices and APIs (Firebase, RxJS) that helped launch a consumer notification platform

Skills

Languages: Python, TypeScript/JavaScript, GraphQL, SQL, HTML/CSS

Frameworks & Libraries: React, Playwright, Node.js, Vite, Angular, pytest, GraphQL Federation, FastAPI, Prisma, Django, Postgraphile

Data & Orchestration: PostgreSQL, PySpark, Druid, SQLAlchemy, ETL pipeline management, Temporal, Jupyter

Infrastructure & Dev Tooling: Docker, Spinnaker, Jenkins, OpenTelemetry, GitOps, Agent-driven development (Codex, Claude, Pi)

Education

University of Waterloo
Waterloo, Canada

Bachelor of Computer Science, Honours (co-op), Double Degree
Sept 2017 - Aug 2022

Wilfrid Laurier University
Waterloo, Canada

Bachelor of Business Administration, Honours (co-op), Double Degree
Sept 2017 - Aug 2022
